CASE-STUDY PROTOTYPE

From scattered signals to the next best conversation

A verifier-first sales copilot for deciding who to call, why now, and what can be said credibly.

01

WHO TO CALL

Prioritize impact

02

WHY NOW

Surface dated signals

03

WHAT TO SAY

Prepare grounded copy

Scope: sales preparation — not clinical decision support or physician-quality scoring.

One workflow. Three answers.

The copilot converts a territory into a call-ready, evidence-backed call plan.

1

PRIORITIZE

Rank providers and accounts by potential impact and evidence confidence.

2

EXPLAIN

Show why now, panel fit, and any identity field that needs verification.

3

PREPARE

Draft a 30-second opener and response to the known concern.

VERIFY

Uncertainty remains visible before outreach; the tool accelerates judgment rather than replacing it.

The screenshot displays the Tempus Sales Copilot interface for a provider profile. At the top, it identifies the provider as Manik Amin, MD, an Internal Medicine and Medical Oncology specialist at the University of Chicago. Key metrics include a priority score of 83, 82/100 identity confidence, 1 contested field, 3 verified claims, 10 sources cited, ~880 estimated patients, and 100/100 fit for xT CDx. A 'WHY NOW' section lists three reasons for outreach: 100 recruiting trials match their focus, a recent publication on DPYD rs4294451, and FDA approval of a labeling supplement for xT CDx. Below this, a 'YOUR OPENER' section provides a 30-second draft script for the salesperson. The interface also shows a map of the Chicago area and a 'VERIFY' button for the provider's information.

WHY NOW

- 100 recruiting trials match their stated focus current
- They published on Association of DPYD rs4294451, plasma uracil concentration, and s... in December 2025 264d ago
- FDA approved a labeling supplement for xT CDx in May 2026 · market-wide 89d ago

YOUR OPENER 30 seconds

Dr. Amin, I came across 100 recruiting trials locally in your area of focus. For KRAS in colorectal cancer, xT CDx showed 100% positive percent agreement and 99.83% negative percent agreement against an externally validated NGS assay. That matters most in gastrointestinal practice when a result has to change a treatment decision. Could we spend fifteen minutes on where comprehensive profiling fits your gastrointestinal workflow?

1 claim verified against cited evidence

EXPECT PUSHBACK ON turnaround time

AI-DRAFTED · EVIDENCE-LINKED · REP-REVIEWED

A verifier-first build: decisions stay deterministic.

The process starts with the rep's decision—not with a model.

BUILD PROCESS + TOOLS

- 1 Frame the rep decision
- 2 Join + normalize sources
- 3 Prototype the workflow
- 4 Attack failure modes + refine

Claude Opus 5 · build-time

React · TypeScript · Vite

Gemini + Groq · runtime

No-key deterministic fallback

DRAFT PROMPT EXCERPT

“Use only supplied EVIDENCE.
Every claim cites evidencelds.
Never state a number absent from cited evidence.
Respond only with JSON.”

Model choice: free-tier availability, speed, and provider independence—not a claim that these models are universally best.

An explainable score—not an AI hunch.

Priority is a transparent 0–100 index; it is not a conversion probability or clinical-quality score.
